SWISSQUOTE CHALLENGE · HACKATHON PROTOTYPE

Client keys. Recovery help. No bank-only payment key.

Three objects. Three jobs.

- **Phone:** pay with the client’s key.
- **Recovery Card:** replace a lost phone with one helper, after a wait.
- **Emergency Kit:** encrypted key backup; separate code to open it.

An accessible or compromised owner key can spend. Keep backup material separate.

Prototype, not FINMA-approved or an endorsed Swissquote product.

Browser recovery verified on Sepolia · resumed across retained browser sessions. Same wallet: old payment → recovery → new-owner 1-USDC payment. Old key refused read-only; new kit rejects wrong code, decrypts offline and matches current owner, not a kit-broadcast exit. Older Compound / scripted kit exit are separate.

Real Sepolia transactions. MOCK bank / identity / helper checks. Virtual WebAuthn; hardware and physical-phone QR scans pending. Three-day route not run in G1. Links need internet.

Keep card words, owner keys and kit codes off the projector.
